### Question 1

Correct

Marked out of 3.00

[Flag question](#)

A set of N numbers (separated by one space) is passed as input to the program. The program number is odd number.

#### Input Format:

The first line will contain the N numbers separated by one space.

#### Boundary Conditions:

$3 \leq N \leq 50$

The value of the numbers can be from -99999999 to 99999999

#### Output Format:

The count of numbers where the numbers are odd numbers.

#### Example Input / Output 1:

##### Input:

5 10 15 20 25 30 35 40 45 50

##### Output:

5

#### Explanation:

The numbers meeting the criteria are 5, 15, 25, 35, 45.

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2
3 int main()
4 {
5     int n,x=0;
6     while(scanf("%d",&n)==1)
7     {
8         if(n%2!=0)
9         {
10             x++;
11         }
12     }
13     printf("%d", x);
14 }
```

Question **2**

Correct

Marked out of 5.00

[Flag question](#)

Given a number N, return true if and only if it is a *confusing number*, which satisfies the following conditions:

We can rotate digits by 180 degrees to form new digits. When 0, 1, 6, 8, 9 are rotated 180 degrees, they become valid digits. When 2, 3, 4, 5 and 7 are rotated 180 degrees, they become invalid. A *confusing number* is a number that, when rotated 180 degrees, becomes a **different** number with each digit valid.

**Example 1:**

6 -> 9

Input: 6

Output: true

Explanation:

We get 9 after rotating 6, 9 is a valid number and 9!=6.

**Example 2:**

89 -> 68

Input: 89

Output: true

Explanation:

We get 68 after rotating 89, 68 is a valid number and 68!=89.

**Example 3:**

11 -> 11

Input: 11

Output: false

Explanation:

We get 11 after rotating 11, 11 is a valid number but the value remains the same, thus 11 is not a confusing number.

**Note:**

- 0 <= N <= 10<sup>9</sup>
- After the rotation we can ignore leading zeros, for example if after rotation we have 0001, it is considered as 1.

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main()
3 {
4     int n,x,y=1;
5     scanf("%d",&n);
6     while(n!=0 && y==1)
7     {
8         x=n%10;
9         n=n/10;
10        if(x==2 || x==3 || x==4 || x==7)
```

REC-CIS

```

13     }
14     }
15     if(y==1)
16     {
17         printf("true");
18     }
19
20     else{
21         printf("false");
22     }
23 }

```

	Input	Expected	Got	
	6	true	true	
	89	true	true	
	25	false	false	

Passed all tests!

## Question 3

Correct

Marked out of 7.00

[Flag question](#)

A nutritionist is labeling all the best power foods in the market. Every food item arranged in a and increasing by 1 for each, until all items have a value associated with them. An item's value has. For example, food item with value 1 has 1 macronutrient, food item with value 2 has 2 mac

The nutritionist has to recommend the best combination to patients, i.e. maximum total of mac avoid prescribing a particular sum of macronutrients (an 'unhealthy' number), and this sum is the increasing order of their value. Compute the highest total of macronutrients that can be p matching the given 'unhealthy' number.

Here's an illustration:

Given 4 food items (hence value: 1,2,3 and 4), and the unhealthy sum being 6 macronutrients matches the 'unhealthy' sum. Hence, one of the three needs to be skipped. Thus, the best com

- $2 + 3 + 4 = 9$
- $1 + 3 + 4 = 8$
- $1 + 2 + 4 = 7$

Since  $2 + 3 + 4 = 9$ , allows for maximum number of macronutrients, 9 is the right answer.

Complete the code in the editor below. It must return an integer that represents the maximum ( $10^9 + 7$ ).

It has the following:

$n$ : an integer that denotes the number of food items

$k$ : an integer that denotes the unhealthy number

**Constraints**

- $1 \leq n \leq 2 \times 10^9$
- $1 \leq k \leq 4 \times 10^{15}$

Input Format For Custom Testing

The first line contains an integer,  $n$ , that denotes the number of food items.

The second line contains an integer,  $k$ , that denotes the unhealthy number.

REC-CIS

2

2

**Sample Output 0**

3

**Explanation 0**

The following sequence of  $n = 2$  food items:

1. Item 1 has 1 macronutrients.
2.  $1 + 2 = 3$ ; observe that this is the max total, and having avoided having exactly  $k = 2$  macronutrients.

**Sample Input 1**

2

1

**Sample Output 1**

2

**Explanation 1**

1. Cannot use item 1 because  $k = 1$  and  $sum \equiv k$  has to be avoided at any time.
2. Hence, max total is achieved by  $sum = 0 + 2 = 2$ .

Sample Case 2

**Sample Input For Custom Testing****Sample Input 2**

3

3

**Sample Output 2**

5

**Explanation 2**

$2 + 3 = 5$ , is the best case for maximum nutrients.

**Answer:** (penalty regime: 0 %)

```
1 #include<stdio.h>
2
3 int main()
4 {
5     long long int n,t,i,nut=0;
6     scanf("%lld %lld", &n, &t);
7     for (i=1;i<=n;i++)
```

REC-CIS

```
10         if(nut==t)
11         {
12             nut=nut-1;
13         }
14     }
15     printf("%lld", nut%1000000007);
16 }
17
```

	Input	Expected	Got	
	2 2	3	3	
	2 1	2	2	
	3 3	5	5	

Passed all tests!
